

Pega Platform Support Guide Resources

The Platform Support Guide contains the list of supported vendor platform components which are required to be installed by clients wanting to create their own installations of Pega Platform. These components include:

- Server hardware
- Cloud Choice options
- Operating systems
- Application servers
- Relational databases
- Java versions

For each of these sections, there are also notes about issues or other important support information.

Since the supported vendor components change over time, different versions of Pega Platform are tested on different versions of the components. Hence, the Platform Support Guide is updated and re-released for each major and minor release of Pega Platform.

The [current Platform Support Guide](#) contains information for **Pega Platform versions 8.1 through 8.4**.

The [Pega 7 Platform Support Guide](#) includes information for **Pega 7 versions 7.1 through 7.4**.

The [PRPC Platform Support Guide](#) has information for **PRPC 5.x and 6.x versions**.

In addition to the components listed above, the Platform Support guide provides information about client-side operating systems, browsers, and mobile platforms. For the PRPC and Pega 7 versions, this information was included in the guide.

Beginning with Pega Platform 7.4, separate articles provide this information:

[Pega Platform Client Operating System and Browser Support](#)

[Pega Platform Mobile Platform Support](#)
